INTRODUCTION

Since 2012, Birdlife Sweden has through the Swedish Taxonomic Committee (STC) provided a publicly available and annually updated list of species occurring in the Western Palearctic realm. In 2025, the taxonomy was aligned with the global unified AviList (AviList Core Team 2025). In this 2026 version, we implement changes in the 2026 update of AviList (AviList Core Team 2026). We also continue to expand the project with more details of records as well as converting the list to English to accommodate international users. Our aim is to construct and maintain the most informative and up-to-date checklist available for birds in the region.

REGIONAL BOUNDARIES

This list includes all species recorded in the Western Palearctic realm, defined here as including Europe, North Africa and southwest Asia east to and including Iran and the Arabian Peninsula, dubbed by Mitchell (2017) as “Greater Western Palearctic”, contrasting “Lesser Western Palearctic” as defined by Cramp (1977–1994).

The coloured area bordered in black depicts “Lesser Western Palearctic”, as used by Cramp (1977–1994). The purple line shows the extended area of “Greater Western Palearctic” used in this checklist. Graphics: Erling Jirle.

In the Atlantic, all ocean waters and islands north of the Tropic of Cancer and east of 30°E are included: Iceland, the Azores, Madeira, the Canary Islands, Cape Verde, and Banc d’Arguin. In the Arctic Ocean, Jan Mayen, Bjørnøya, and Spitsbergen are included, as well as Franz Josef Land, Novaya Zemlya, and Vaygach. The western border follows the Denmark Strait midway between Greenland and Iceland north to 90°N, then eastwards to 70°E, where it continues southwards east of Novaya Zemlya and Vaygach, reaching land at the northernmost point of the Ural Mountains in the Kara Sea.

The eastern boundary follows the Urals southwards along the watershed, the Ural River, the centerline of the Caspian Sea and the Iranian border with Turkmenistan, Afghanistan, and Pakistan down to the Arabian Sea. The entire Arabian Peninsula is covered, including

offshore islands, but not Socotra. In Africa, the southern boundary generally follows 21°N, from Ras Nouadhibou (Cap Blanc) in Western Sahara to the Red Sea. Northern Chad south to 19°N is covered as well, including the Tibesti massif.

Note that the regional boundary in Africa is subtly different compared to Mitchell (2017). Therein, the boundary instead follows 20°N from Mauritania to Chad, where it heads south to 18°N around Tibesti, east along 20°N again to the Libya–Sudan border, and finally follows the Egyptian border along 22°N. Compared to Mitchell (2017), this checklist thus covers a smaller region in northern Mauretania and southern Algeria, slightly different areas of northern Chad, and includes northern Sudan as well as Gebel Alba.

TAXONOMY

Up until 2025, BirdLife Sweden maintained an independent taxonomy. It largely followed Voous (1973, 1977) until 2018, after which IOC became the backbone. However, there were some deviations in species limits, genera assigned, and linear sequence. The rationale for maintaining a separate national list was rooted in the confusing global situation, with several competing world bird lists, each based on its own system. The aim was to capture knowledge about the birds in our

region in a more focused way. Other countries had done the same, resulting in an even more fragmented regional situation. Attempts to harmonize the lists through AERC had ultimately stalled.

Following an initiative at the International Ornithological Congress in 2018, however, work began to bring three of the world bird lists (eBird/Clements, HBW/BirdLife International, and IOC) together into a single global bird list. This work resulted in the unified and independent AviList, made public on 11 June 2025. As a result, the arguments for maintaining a separate systematic list no longer apply, and the STC therefore decided to adopt AviList.

The transition entailed a considerable number of changes, partly due to differing interpretations of data. In this respect, AviList takes a more conservative approach than the STC had done. As a result, a number of species were lumped pending further studies. STC also often acted relatively quickly to implement new research findings, several of which had not yet been assessed by AviList.

In its first version, AviList focused on species for which the assessments differed between the world lists, and newly published findings could not be prioritized. When this research is taken into account in later versions of AviList, species that the STC previously treated as separate, which are currently lumped, may therefore be split again.

VERACITY OF RECORDS

Inclusion of records follows Mitchell (2017) up to 2013. Note that the regional border in Africa is slightly different from Mitchell (2017), who included a larger area in the west, but a somewhat smaller area in the east. This results in the exclusion of some Mitchell (2017) records from northern Mauritania and southern Algeria, while additional records from southern Egypt and northern Sudan have been included.

Records later than 2013 are included based on the following:

- Records accepted by national rarities committees and included in official national lists for those countries that publish decisions on an annual (or similarly regular and frequent) basis.
- Clearly substantiated records in countries (1) lacking rarities committees and/or official national lists or (2) where rarities committee reports are scarce and national lists are updated only intermittently. These records are noted with an asterisk (*) in the far right column.

The situation in southern Algeria is especially difficult to assess. Not only are many records unsubstantiated, but they can also refer to escapees. These records can therefore only be considered best guesses at the moment, also denoted with an asterisk.

LIST STRUCTURE AND EXPLANATIONS

Each species is represented in the list with its scientific, English and Swedish name. English names follow AviList, Swedish names STC. Occurrence in the region as defined here is noted in the first column, followed by the more restricted definition by Cramp (see above) in the second, and in the third Europe as contemporarily defined.

The occurrence is categorised as either breeding (B), breeding unclear or irregular (b), migrant and/or wintering (M), introduced (I), or vagrant (V). Included introduced species are those included in country lists in the AERC category C as breeding.

In the far right column, vagrant details and endemism is noted. Vagrancy is defined as in Mitchell:

- Extreme vagrant: 1–10 records
- Very rare vagrant: 11–50 records
- Rare vagrant: 51–100 records

For extreme vagrants, records are noted in full (year and country) only for species recorded three times or less. Country abbreviations are ISO alpha-3 codes. An asterisk (*) next to a country abbreviation refers to records not yet treated by national rarities committees, which we presume will likely be accepted in the future.

CHANGES IN THE CHECKLIST

The current version of the checklist contains 1191 species. Since the previous version, 14 species have been added and four removed, due to taxonomic changes and new or re-evaluated records. Three genera have been added, and one changed. One scientific and two common species names have been adjusted due to an extralimital split. All changes are noted in red in the checklist.

TAXONOMIC CHANGES

The most recent update of AviList released in October 2026 (AviList Core Team 2026) has resulted in the addition of five species:

- Prairie Willet *Tringa inornata* is split from Willet *T. semipalmata*, renamed Saltmarsh Willet *T. semipalmata*.
- Mediterranean Flycatcher *Muscicapa tyrrenica* is split from Spotted Flycatcher *M. striata*, resulting in a new breeding endemic species for the Western Palearctic region.
- Canary Islands Robin *Erithacus superbus* (including *marionae*), is treated as a separate species from European Robin *Erithacus rubecula*. The species is endemic to the region.
- Previously accepted on the checklist and then lumped to align with AviList, Maghreb Wheatear *Oenanthe halophila* is once again split from Mourning Wheatear *O. lugens*, resulting in the addition of another regional endemic.

Three further species are affected by extralimital splits:

- Extralimital House Swift *Apus nipalensis* has been lumped with Little Swift *A. affinis*. This lump does not affect the list, as English and scientific names stay the same.
- Warbling Vireo *Vireo gilvus* is split into Eastern Warbling Vireo *V. gilvus* and Western Warbling Vireo *V. swainsoni*, the former being recorded in the region.
- Blue Whistling Thrush *Myophonus caeruleus* is split into Chinese Whistling Thrush *M. caeruleus* and Yellow-billed Whistling Thrush *M. flavirostris*, the latter recorded in the Western Palearctic.

There are also two changes at the generic level:

- Eurasian Wren *Troglodytes troglodytes* is moved to *Nannus*, as members of *Troglodytes* as previously circumscribed are not each other's closest relatives.
- The large bunting genus *Emberiza* is split into four: *Fringillaria*, *Schoenichus*, *Melophus*, and *Emberiza* in the restricted sense. The rationale behind is that *Emberiza* as previously defined comprised very old intrageneric splits, some even older than other entire bird families.

DISTRIBUTIONAL CHANGES

New records and review of older records and national lists result in the addition of nine species to the checklist. Four are introduced species that have established free-ranging populations:

- Indian Peafowl *Pavo cristatus* in Croatia
- Chilean Flamingo *Phoenicopterus chilensis* in the Netherlands
- Black-breasted Weaver *Ploceus benghalensis* in Qatar
- Black-rumped Waxbill *Estrilda troglodytes* in Spain

Furthermore, five species are now considered to be documented vagrants to the region:

- Mongolian Gull *Larus mongolicus* in Iraq (1926) and Iran (2019)
- Black-headed Cuckooshrike *Lalage melanoptera* in Iran (2025)
- Indian Golden Oriole *Oriolus kundoo* also in Iran (2025)
- Plumbeous Water Redstart *Phoenicurus fuliginosus* in Russia (2017)
- Little Weaver *Ploceus luteolus* in Algeria (2025)

Four species have been removed following reassessment. Northern Giant Petrel *Macronectes halli* was erroneously added based on the remarkable find of remnants of a *Macronectes* in Turkey. However, these have not been definitively assigned to species, and *M. halli* is thus deleted. After review, three more species have been deleted as the records are from just outside the Western Palearctic boundaries as defined here: Brown Snake Eagle *Circaetus cinereus*, Grasshopper Buzzard *Butastur rufipennis*, and Cut-throat Finch *Amadina fasciata*.
